

Name:

Look up five random images prepared for you and describe the **shape** and **pattern** of the **settlements** and nearby **agriculture**.

| Location                         | Description (approx. 100 words each)   |
|----------------------------------|--|
| Dunfield, United Kingdom         | There is a lot of grassland/ farmland in this image. The land is divided into a lot of geometric shapes with straight sides and sharp edges. The land has a distinct farming pattern of straight lines in multiple rows, which looks as though the space is used for growing crops. In the upper left hand corner there are many trees. There is a portion of land that looks like it's separated into long rectangles. Between each piece of land, there are horizontal rows of trees. To the right of that is a tree line that divides this particular space from other grassland areas in Dunfield. This is the only section shown in the image, which contains a cluster of scattered trees. The other places that trees reside are along the borders of farmland and one particular area that could be a forest. There are about 3 clusters of houses/buildings seen in this image, and a giant airport runway that's in the center of everything. This runway is designed in a rectangular shape that branches off into what looks like little trapezoid pieces. There doesn't seem to be a lot of roads, but the ones that are present are relatively straight with slight curves. There are two patches of land that appear to be desert like, but both of them are near small bodies of water (one looking like a pond, the other a river). |
| Lai Vung, Vietnam                | When looking at this image of Lai Vung, the word diamond came to my mind because the farmland is separated into geometric shapes (mostly a triangle formation). All of the buildings/houses reside along the side of the roads. The majority of the roads in this image are straight, but in the upper right hand portion of this image there are curvy roads with an abundance of buildings/houses located along its path. Most of the pieces of land are light green, while others are a dark green or a light tan. This could show the differences in the soil types, or the separation of ownership for the different pieces of land.  |
| Isle of Anglesey, United Kingdom | The first thing I notice about this image of Isle of Anglesey is the big river that flows through the center of everything. It is noticeable that some areas of the river are deeper than others, by the colors that are shown. Shallow water has more of a presence near the edges of the river ( more so the right side), where a beach appears to be. This beach is the most prominent one, but there are a few smaller areas of beach along the coast of the river. The left side of the river contains three large size towns/communities in shapes of circles. On the opposite side of the river (right side) there is one town that seems to branch off of a larger community. That larger community is in the shape of a rectangle. There are many divisions in the land which look like they are separating different farmlands. The pattern of this land is mostly in the shape of squares, but other shapes are noticed too such as variant forms of triangles. The area that has this land seems to be flat, whereas the opposite side of Isle of Anglesey has many more trees of which are mostly scattered about. Some dispersed areas of woodlands or forests are also present in this image and the roads consist of soft curves that are long in length.  |

|-------------------------|---|
| Pomeroy, United States  | <p>In this picture I see mountainous terrain all over the image. The image has tan mountains in the center that fade into green mountains. The green areas could show possible signs of grass, plants, or trees. However, there are no distinct images of trees, so that's mainly a speculation. There are two wide rivers that travel along the left and right sides of this image of Pomeroy. The rivers look thick and dark which can indicate deep waters. They are also curvy and branch off into smaller, narrow rivers. I see rocky terrain and many narrow winding valleys throughout the rest of the image.</p>  |
| General Roca, Argentina | <p>The shape of the settlement General Roca looks similar to an oval. The middle portion of this settlement is just a bit wider than the sides. There are two sets of mountains that can be seen in this image of General Roca. The mountains toward the bottom of the page contain a few sporadic pieces of land and numerous river paths that connect as they wind down the side of the mountain. The roads are pin straight with one wide road going horizontal through the image. The buildings I see are spread out among the different sections of land, with none being in one localized place. The land that I see is divided into very small portions compared to other locations I have viewed, and this makes the appearance of the town look a lot bigger. There doesn't seem to be much farmland, but there is a small area in the center of the map that's colored brown/green. This could be an area where farmland is located, or it could be an area of grassland.</p> |
